PARTNER DEX VENUES

Trade perps onchain, keep earning cashback

You already know perpetual futures. Learn what changes when the DEX Venue is decentralised, compare Aster, Hyperliquid and Lighter side by side, then choose the route that fits how you trade.

Learn the Basics | Compare DEX Venues

Leveraged perpetual trading carries a high risk of rapid loss. On a decentralised DEX Venue you also hold your own keys, so there is no account recovery and no support desk that can reverse a transaction.

What Changes | How It Works | Funding Path | Learn Track

WHAT CHANGES

You know the trade. The DEX Venue is what changed.

Funding rates, liquidation and leverage tiers work the way you already expect. What is different is who holds your collateral, where the order book actually lives, what happens when the operator goes down, and whether anyone can prove the fill you got was fair.

You hold the keys	The order book has an address	Fees look lower, cost is not always lower

HOW IT WORKS

Three DEX Venues, three different bets

Aster, Hyperliquid and Lighter solve the same problem in three genuinely different ways. Understanding which trade off each one made is most of the decision.

Aster	Hyperliquid	Lighter
Widest surface area. Very high leverage, tokenized equities, forex, prediction markets. [status chip] View details >	Fully onchain order book on its own L1. Deepest liquidity, most markets. [status chip] View details >	zk rollup on Ethereum. Proves matching and liquidation. Zero fee standard tier. [status chip] View details >

FUNDING PATH

Getting funds from an exchange to a DEX

None of these DEX Venues accept fiat, in any currency. The route runs through a licensed exchange in your own market, and the withdrawal step is the part that catches people out.

1 Buy or hold stablecoins on a licensed exchange
Any licensed exchange that supports a bank account in your currency. Your funds start here, not in a wallet.

2 Withdraw to a wallet you control
WARNING: Travel Rule applies here. Destination wallet verification required. Expect delay or rejection if unverified.

3 Bridge to the network the DEX Venue accepts
Aster: BNB Chain, Arbitrum, Ethereum, Solana. Hyperliquid: USDC on Arbitrum. Lighter: Ethereum settlement.

4 Deposit and confirm the rebate route is attributed
Confirm the TetherMax referral or builder attribution shows before your first trade.

Regulatory position for your jurisdiction, as at {date}: {admin authored status copy per DX-70}. Resolved against the reader detected jurisdiction. Local tax treatment of trading gains varies by jurisdiction and is not covered here.

UNDERSTAND THE RISKS

Decentralised does not mean safer

- Leverage still cuts both ways
- Operator concentration is real
- Smart contract and bridge risk
- There is no recovery
- Volume is not always what it looks like

This page is provided for general educational purposes only and does not constitute investment advice. Review each DEX Venue own risk disclosures before depositing.

HOW TO BEGIN

A simple 4 step path

Step 1	Step 2	Step 3	Step 4
Learn what changes	Compare the three DEX Venues	Open through the TetherMax route	Fund and verify before you size up

Footer: Live Chat | support@tethermax.io | Company | Legal | Socials | legal line

DX-1 Hero. H1, subhead, both CTAs and the risk disclaimer must all sit above the fold at 1440 by 900 and at 390 by 844. The risk line is never behind a disclosure toggle. Below 768px the CTAs stack full width at 48px minimum tap height.

DX-2 Anchor bar pins at top 64px under the global header. Active state follows the section in view. Below 768px it scrolls horizontally, it never wraps to two lines. Same component as /en/brokers.

DX-3 Three cards only. Miller's Law: this is the first substantive block and the reader is still orienting. Cards are explanatory, not links.

DX-4 Hick's Law: exactly three options at the point of first choice. Each card leads with the one trait that makes that DEX Venue unlike the other two, so the cards are never interchangeable. Access status chip renders when status is watch or restricted.

DX-5 Funding path. No equivalent on /en/brokers, because an FX broker accepts a card or bank deposit and a DEX accepts nothing but crypto. Travel Rule warning sits on step 2 where it actually bites (Tesler's Law: the complexity cannot be removed, so surface it at the point of pain). The regulatory status line is content managed per jurisdiction with a visible as at date, because it is expected to change.

DX-6 Risk panel. Five stacked full width rows, never a card grid, because a grid makes risks look like features. All five rows carry identical visual weight. No CTA inside this panel, and that is a policy decision rather than an oversight.

DX-7 Goal Gradient Effect: an explicit finite path raises completion. Step 3 links to Compare, never to a single DEX Venue, so the page never appears to pick a winner.

DX-8 Single open accordion, item 1 open on load, matching /en/brokers. Q3 is the access question and sits third so it is visible without scrolling the accordion. Its answer resolves against the reader jurisdiction. FAQPage structured data emitted for all six pairs.

Learn Track, index and article

/en/dex/learn and /en/dex/learn/{slug}

tethermax.io/en/dex/learn

DEX Trading / Learn

The DEX Learn Track

Eight modules for traders who already know perpetual futures. Nothing here re explains what a perp is. Every module answers one question: what is different when the DEX Venue is decentralised.

3 of 8 complete

1 Custody, keys and what you actually own [done]

2 Where the order book lives: onchain matching, zk rollups and sequencers [done]

3 Oracles and mark price: how your liquidation level is decided [done]

4 Funding rates onchain: intervals, clamps and peer to peer settlement 6 min read

5 Liquidation, insurance backstops and auto deleveraging 6 min read

6 The true cost of a round trip: fees, depth, slippage, gas 6 min read

7 Points, airdrops and why reported volume can mislead 6 min read

8 Failure modes: sequencer halts, escape hatches, validator intervention, bridge risk 6 min read

Footer

DX-11 Learn index. Fixed curriculum order 1 to 8 by an explicit sort field, never by publish date, because the modules build on each other. Zeigarnik Effect: an explicitly incomplete sequence pulls the reader back. Progress persists to local storage when signed out and to the account when signed in.

tethermax.io/en/dex/learn/where-the-order-book-lives

DEX Trading / Learn / Module 2

Where the order book lives

Module 2 of 8 6 min read

What you already know

On a centralised exchange the matching engine is a black box you trust because the operator is a regulated business with something to lose. Everything below assumes you already understand limit orders, maker and taker roles and how a book fills. This module only covers where that book actually runs when there is no operator to trust.

[body content: H2 and H3 structure, diagrams, code free explanation]

On this page
What you already know
Onchain matching
zk rollup with proven matching
Sequencer and soft finality
How the three DEX Venues compare
Regional note

How the three DEX Venues compare

REQUIRED BLOCK: three DEX Venue comparison

Aster: matching on its own chain, degree of off chain sequencing not published
Hyperliquid: every order, cancel and fill is a consensus transaction on the L1
Lighter: matching and liquidation proven with zk proofs, verified on Ethereum

REQUIRED BLOCK: regional note

What this topic means depending on where you live and where your funds start.

REQUIRED BLOCK: What this means for choosing a DEX Venue

Three to five lines. No article may recommend a single DEX Venue.

Shown to signed out readers only

Footer

DX-12 Article shell reuses /en/beginner-guide exactly, including the anchored right margin node behaviour. Below 1024px the right margin table of contents is replaced by a collapsible On this page block under the title.

DX-13 Content standard, enforced by publish validation and not by review discipline. Every article needs the three DEX Venue comparison and the closing What this means block. Modules 1, 6 and 8 also need the regional note, because custody, cost and failure modes all have jurisdiction specific consequences. No article may recommend a single DEX Venue, which is what protects the neutrality the compare page depends on.

DX-12 Module 8 next control links to /en/dex/compare rather than to another module. That is what closes the education to decision loop.

PARTNER DEX VENUE COMPARISON

Compare Aster, Hyperliquid and Lighter

Thirty traits across five areas, including the trust and verifiability traits that have no equivalent in centralised exchange comparisons. Every figure is dated and sourced.

STICKY DEX VENUE BAR pins on scroll past the table header [Aster: Sign Up] Details] [Hyperliquid: Sign Up] Details] [Lighter: Sign Up] Details]

	[logo] Aster [status chip: resolves per jurisdiction] [Sign Up] [View Details]	[logo] Hyperliquid [status chip: resolves per jurisdiction] [Sign Up] [View Details]	[logo] Lighter [status chip: resolves per jurisdiction] [Sign Up] [View Details]
CORE TRAITS 6 traits Who the DEX Venue is for, how it is built, what you are handing over [-]			
Best for	High leverage speculators. Equities, forex and prediction markets onchain.	Serious directional and systematic traders who need depth across many markets.	Cost sensitive active traders who want matching and liquidation proven.
Architecture	Multi chain plus its own L1. Order book in Pro mode, simplified high leverage mode alongside.	Fully onchain central limit order book on its own Layer 1. Matching inside the chain.	Application specific zk rollup settling to Ethereum, with proven matching and liquidation.
Settlement chain	BNB Chain, Arbitrum, Ethereum, Solana, plus Aster Chain.	HyperliquidL1. Canonical deposit route is USDC on Arbitrum.	Ethereum. Assets held in Ethereum contracts.
Custody model	Self custodied by wallet. Email login generates a DEX Venue created wallet, which is a weaker custody position.	Self custodial throughout.	Self custodial, assets held in Ethereum contracts.
KYC requirement	Not required for standard trading. Discretionary verification clause in terms.	Not required for retail perp trading.	Not required. Terms only require you are not a prohibited person.
Login method	Wallet or email.	Wallet only.	Wallet only.
FEES AND REBATES 6 traits Maker, taker, trader discount, rebate route, funding interval, gas			[+]
TRADING 6 traits Leverage, markets including equity and RWA perps, margin modes, order types, mobile, API			[+]
SPECIAL TRAITS 6 traits Verifiable matching, privacy, points, token, vaults and pools, multi asset collateral			[+]
TRUST AND RISK 6 traits Backstop, audits, incident history, operator concentration, exit, regions			[+]

Figures as at {date}. Source links held on each DEX Venue record.

Trading conditions, fees, leverage limits, market availability and regional access may change without notice and may differ by account tier and product mode. Every figure on this page is indicative and dated. Confirm current terms on the DEX Venue own site before depositing.

Indicative DEX Venue conditions. Confirm on the DEX Venue own site.
* Rebate terms. Rates are subject to the current agreement between TetherMax and the DEX Venue and may vary. Registration must run through the TetherMax route or the rebate is not attributed.
^ Processing and payout timing.

HOW TO PROCEED

Your next steps

Step 1 Shortlist to one DEX Venue | Step 2 Open through the TetherMax route | Step 3 Fund from your exchange (links to /en/deeMFunding) | Step 4 Verify attribution before you size up

Still deciding? Start with what changes
If any row in that table needed explaining, the Learn track covers it in eight modules written for traders who already know perps.
[Learn the Basics]

Footer

DX-27 Sticky DEX Venue bar. Fitts's Law: on a table thirty rows long the CTA has to travel with the reader. It pins past the table header and unpins past the end of the table. Placement is a Mixpanel property so sticky bar conversion is comparable with header and bottom banner conversion.

DX-21 Five named groups of six beats thirty rows at once (Hick's Law plus Miller's Law). Groups toggle independently rather than as an accordion, because a trader comparing fees and risk must hold both open. Group 1 is expanded on load so the page is never empty. Every expansion fires a Mixpanel event: a group nobody opens is badly named or badly placed.

DX-22 Best for is row one because it is the row that lets a reader rule out two columns immediately. Values are prose, never star ratings, because a score implies TetherMax ranked them. No cell is ever blank: unknown reads "Not published by the DEX Venue".

DX-23 Where published fee figures conflict across sources, the cell states the range and names the product mode each figure applies to. False precision is worse than an honest range. A zero fee headline always carries its account tier condition in the same cell.

DX-24 Equity and RWA perp availability is stated explicitly in the Markets row for every DEX Venue, including Not offered, because non crypto markets are one of the largest documented drivers of volume to these DEX Venues. Leverage cells always name the asset the maximum applies to.

DX-25 Verifiable matching is stated as a spectrum, not a yes or no. Proving settlement, proving execution and proving matching are three different claims and a binary would flatter one DEX Venue and misrepresent another.

DX-26 Known incident history is a MANDATORY row and never blank. A DEX Venue with none shows "No publicly documented incident to date". Where an incident exists the cell states what happened and what the DEX Venue changed afterwards, which is what separates disclosure from fear mongering. Access status appears here too, not only in the page notice.

DX-29 Publish validation blocks any footnote marker used with no matching footnote entry. An orphan marker is worse than no marker.

About Hyperliquid

Hyperliquid runs a fully onchain central limit order book on its own Layer 1. Two coupled execution environments, HyperCore for the exchange state machine and HyperEVM for general contracts, sit under HyperBFT consensus. Every order, cancel and fill is a consensus transaction, so execution is publicly auditable rather than taken on trust.

DEEP LIQUIDITY | ONCHAIN CLOB | PERMISSIONLESS MARKETS

Company Profile
Architecture Own Layer 1, onchain CLOB
Settlement layer HyperliquidL1
Launched 2023, token from Nov 2024
Token HYPE, live
Audit status Bridge contract audits published, L1 coverage narrower
Restricted regions United States, Ontario, sanctioned jurisdictions.

Fees and account tiers

Get set up and attributed

A 4 step path from wallet to first attributed trade ^

[1] [2] [3] [4]

Step 1 Open through the TetherMax route
Connect your wallet using the TetherMax referral link so attribution is recorded from your first trade. There is no account creation and no KYC step.
[referral link]

Trading conditions and costs

Typical costs #

Market	Round trip cost
BTC perp	…
ETH perp	…
SOL perp	…
Equity perp	…
Gold perp	…

Trading conditions

Order types	Limit, market, reduce only, stop, take profit, scale, TWAP
Margin modes	Cross default, isolated on selected assets
	Self trade prevention …
API access	REST and WebSocket, agent wallets, sub accounts, testnet
Mobile app	State what is known and what is not

What you are trusting

Who holds your collateral	Self custodial throughout. Assets sit in contracts you can exit from.
Who orders and matches your trades	A small validator set under HyperBFT consensus. Every order is a consensus transaction.
What is proven versus what is trusted	Execution is publicly auditable onchain. Matching correctness is not separately proven the way a zk rollup proves it.
What happens if the operator stops	State the documented mechanism, or state plainly that none is documented.

Incident history

March 2025 An outsized ETH position was deliberately self liquidated, costing the HLP vault roughly 4 million USD.
March 2025 The JELLY squeeze cost HLP roughly 13 million USD unrealised. The validator set voted to delist the market mid squeeze and settle at a favourable price, and non flagged users were made whole.
What changed Validator processes were revised and onchain validation was added for delisting decisions.

Regional access note
Restricted list Whether your jurisdiction appears on the DEX Venue own restricted list.
Deposit route Which networks are reachable from a fiat exchange withdrawal.
Equity and RWA Whether non crypto perp markets are offered.

Footer

DX-40 Hero mirrors the RS Finance layout: the headline commercial number sits in a card on the right at the same eye level as the DEX Venue identity on the left. Where terms are not yet signed the card renders a pending state reading "Rebate route in negotiation" with a single View DEX Venue CTA. A fake number is never shown.

DX-41 Four stats, matching the FX detail page. These are the four numbers a returning member scans before reading any prose, so they sit above every block of text. An unconfirmed value states the known part plus the word indicative, never a placeholder or a zero.

DX-42 Profile card refuses "N/A". An unknown stated as an unknown is information. A blank is not.

DX-43 Tier cards are ordered ascending by cost to the trader. Any condition attached to a zero fee or discounted headline is stated INSIDE the card, never pushed to a footnote, because a trader who reads only the card must not be misled.

DX-44 Doherty Threshold: the stepper swap must be instant with no network call, so all four panels render and hide rather than fetch. The dots must carry accessible names and be keyboard operable. The unlabelled dot control on the FX page is the one thing not to copy.

DX-46 This block has no equivalent on /en/brokers and is the reason a DEX detail page is not a broker page with different logos. The incident block stays visible when empty, so the absence of incidents is itself readable as information. Every listed incident carries a remediation line.

DX-47 The regional access note appears on every detail page, not only where there is something to warn about, so its absence never has to be interpreted.

DX-61 TRAP TO AVOID. Where a DEX Venue integrator route requires the trader to sit on a paid account tier, that condition MUST be stated in the tier module here and in the compare page rebate route cell. A rebate route that silently moves a trader off a zero fee tier costs them more than the rebate returns until they trade real volume. Publish validation blocks the page if it is unstated.

DX-60 Every outbound link resolves through one attribution service, never a hardcoded href. DEX Venue records hold a referral URL, an optional builder code and a primary route flag. If neither is configured the CTA renders disabled reading "Route coming soon", so a half configured DEX Venue can never leak an unattributed link. That leak is the failure mode this whole project exists to fix.
